DEV-23 Structure Your Errors In OpenEdge 10.1C

Peter van Dam

What is Structured Error Handling?

- Modern – Object-oriented (but you don't have to know much about OO to use it)
- Can catch errors that could not be caught before
- Can co-exist and interoperate with traditional error handling
- This talk presents practical examples of adding structured error handling to existing applications

DEV-23: Catch Me if You Can – Practical Structured Error Handling

Agenda

- Introduction
- **FINALLY!**
- The ProError Object
- CATCHing Errors
- Propagating Errors Up The Call Stack
- Limitations and workarounds

DEV-23: Catch Me if You Can – Practical Structured Error Handling

First of All: FINALLY

Introducing the FINALLY block

- FINALLY is a new block statement that you can use right away
- FINALLY always executes, whether an error was raised or not
- FINALLY must come after all other executable statements in a block
- Intended for clean-up code
- Examples: delete objects, close streams, write logs etc.

DEV-23: Catch Me if You Can – Practical Structured Error Handling

DEV-23 Structure Your Errors In OpenEdge 10.1C

Peter van Dam

Using FINALLY to Prevent Memory Leaks

Solving the OUTPUT TABLE-HANDLE problem

- TABLE-HANDLE parameters create a TEMP-TABLE in the SESSION Widget Pool
- You are responsible for cleaning it up
- That can be difficult to manage
- Error conditions can also bypass your cleanup code

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Creating A Memory Leak

OUTPUT TABLE-HANDLE

CREATE TEMP-TABLE

- memleak2.p contains a CREATE TEMP-TABLE statement that creates the TEMP-TABLE in the current WIDGET-POOL
- The temp-table received by memleak1.p is created in the SESSION WIDGET-POOL

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Demo: memleak.p

DEV-23: Catch Me If You Can - Practical Structured Error Handling

DEV-23 Structure Your Errors In OpenEdge 10.1C

Peter van Dam

FINALLY in Practice

- FINALLY always executes, on success or failure
- From now on I put all my DELETE OBJECT statements in FINALLY blocks
- Starting with the examples in this presentation!

10 DEV-23: Structure Your Errors In OpenEdge 10.1C

Agenda

- Introduction

Peter van Dam

Enabling Stack Tracing

- Adds overhead – not enabled by default
- You must use the `-errorstack` startup parameter or `SESSION:ERROR-STACK-TRACE` to enable Stack Tracing
- Enable this feature in your startup procedure when `SESSION:DEBUG-ALERT` is `TRUE`
- This feature enables you to access the stack trace in the `Callstack` property of error objects

DEV-23: Catch Me if You Can – Practical Structured Error Handling

Catching Errors

You can now catch everything that was hard to catch before

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Catching System Errors

Catching Errors While Printing

```
OUTPUT TO print.txt.  
FIND customer WHERE custNum EQ 1000 NO-LOCK.  
PUT UNFORMATTED NAME SKIP address.  
OUTPUT CLOSE.
```

- The error (customer 1000 does not exist) will end up in your output file and you might not even notice

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Catching System Errors

Catching Errors While Printing

```
OUTPUT TO print.txt.  
FIND customer WHERE custNum EQ 1000 NO-LOCK.  
PUT UNFORMATTED NAME SKIP address.  
OUTPUT CLOSE.  
CATCH e AS Progress.Lang.ProError :  
  MESSAGE "Error occurred during printing:" SKIP  
  e:getMessage(1) VIEW-AS ALERT-BOX ERROR.  
  DELETE OBJECT e.  
END CATCH.
```

- Merely adding a CATCH block will address this situation

Demo: print.p

Future Proof SOFTWARE **Exchange 10.1C**

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Methods On Built-in System Handles

The following code does not raise an error condition:

```
DEFINE VARIABLE hBuffer# AS HANDLE NO-UNDO.  
CREATE BUFFER hBuffer# FOR TABLE "customer".  
hBuffer#:FIND-UNIQUE("WHERE CustNum EQ 1000").
```

- The reason is that errors arising from methods on built-in system handles are treated... 'differently'.

Future Proof SOFTWARE **Exchange 10.1C**

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Methods On Built-in System Handles (2)

Errors on built-in system handles are treated 'differently'

- The result is that an error message is displayed on standard output *and processing continues!*
- There is no error condition
- This is pretty bad as it is, and absolutely horrible when it happens on your AppServer
- When **any** relevant CATCH block is present, built-in ABL methods raise error.

Future Proof SOFTWARE **Exchange 10.1C**

Propagating Errors Up The Call Stack

Generic Error Handling With Ajax

```
CATCH errorObject AS Progress.Lang.SysError:  
  DEFINE VARIABLE iMessage# AS INT NO-UNDO.  
  DEFINE VARIABLE hSAXWriter AS HANDLE.  
  CREATE SAX-WRITER hSAXWriter.  
  hSAXWriter:FORMATTED = TRUE.  
  hSAXWriter:SET-OUTPUT-DESTINATION("STREAM", "WEBSTREAM").  
  hSAXWriter:START-DOCUMENT().  
  hSAXWriter:START-ELEMENT("error").  
  
  DO iMessage# = 1 TO errorObject:numMessages:  
    hSAXWriter:WRITE-DATA-ELEMENT("errorMessage", errorObject:getMessage(iMessage#)).  
  END.  
  
  hSAXWriter:END-ELEMENT("error").  
  hSAXWriter:END-DOCUMENT().  
  
  DELETE OBJECT hSAXWriter.  
  DELETE OBJECT hTable NO-ERROR.  
  DELETE OBJECT errorObject.  
  
END CATCH.
```

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Propagating Errors Up The Call Stack

Return any errors as XML

```
<error>  
  <errorMessage>message 1</errorMessage>  
  <errorMessage>message 2</errorMessage>  
</error>
```

- In this way errors can be processed generically on the Ajax client as well

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Propagating Errors back to an Ajax client

Agenda

- Introduction
- FINALLY!
- The ProError Object
- CATCHing Errors
- Propagating Errors Up The Call Stack
- **Limitations and workarounds**

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Limitations of Structured Error Handling

- Cannot THROW an Error Object across an AppServer boundary
- Cannot catch STOP
- Cannot catch QUIT

DEV-23: Catch Me If You Can - Practical Structured Error Handling

Catching the STOP condition

```
DO ON STOP UNDO, RETRY:
  IF RETRY THEN
    UNDO, THROW
  NEW Progress.Lang.AppError("Program not found",1).
  RUN nonexistent.p.
END. /* ON STOP... */

CATCH eError AS Progress.Lang.ProError:
  MESSAGE eError:getMessage(1)
  VIEW-AS ALERT-BOX ERROR.
  DELETE OBJECT eError.
END CATCH.
```

DEV-23: Catch Me If You Can - Practical Structured Error Handling

DEV-23 Structure Your Errors In OpenEdge 10.1C

Peter van Dam

Conclusions

First structured error handling steps

- Start using FINALLY blocks wherever that makes sense
- Start adding CATCH blocks to your top-level procedure(s)
- Start adding ROUTINE-LEVEL ON ERROR UNDO, THROW statements to your secondary procedures
- Subsequently add CATCH blocks in your other blocks
